Department: BCA **Year:** III BCA

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Problem Statement: The existing laptop procurement process can involve manual requests, approval follow-ups, ordering and tracking. This can take time and make it difficult to monitor request status.

Selected Problem: Create a simple system that standardizes laptop requests and automates the approval, ordering and tracking process.

Users / Stakeholders

Stakeholder	Need
Employee / Requester	Submit a laptop request and check its status.
Approver / Admin	Review and approve or reject requests.
Procurement / Company	Place standard laptop orders and track them.

Step-2: Brainstorm, Idea Listing and Grouping

Group	Brainstormed Idea
Request	Online laptop request form; employee details; laptop requirement selection.
Approval	Admin approval/rejection; request status; approval history.
Standardization	Predefined standard laptop models/specifications; avoid unnecessary configuration differences.
Ordering	Approved requests converted into standard laptop orders; order status tracking.
Tracking	Dashboard showing pending, approved, ordered and completed requests.
Notifications	Status updates for requester and admin.
Reporting	Basic reports for requests, approvals and orders.

Key Concept Selected: A centralized laptop procurement workflow that lets users submit requests, admins approve them, and procurement teams track standard laptop orders.

Step-3: Idea Prioritization

Priority	Idea	Reason
1	Request + Approval Workflow	Core process needed to move a request from submission to approval.
2	Order & Status Tracking	Makes approved requests easier to manage and monitor.
3	Standard Laptop Catalog	Keeps laptop choices consistent and simplifies procurement.
4	Admin Dashboard	Provides a central view of pending and completed requests.
5	Notifications	Helps users know when their request status changes.
6	Reports	Useful for reviewing procurement activity and records.

Expected Outcome: A simple and organized laptop procurement system that reduces manual work, saves time, improves visibility of request status, and supports standardized laptop ordering.
